

## What is learning?

Learning is taking something you don't know and attaching it to something you already know. Can you recite the alphabet without singing it?

## Why can't I just memorize all this stuff?

Answering this question would take hours and hours. However to make a long story short, think of the brain as a blank computer screen. As words are typed on the key board, they appear on the screen. If the words that appear on the screen are not saved, they would disappear once the computer is turned off. However, if the words were saved, they could be "recalled" over and over again.

The human brain reacts the same way, new information is stored in short term memory. To really learn something you need to "rehearse" and practice pulling out the information over and over again.

When you memorize the "stuff" never gets past here

When you learn the "stuff" gets to here and can be recalled again and again and again.....
